Abstract

The objective of this paper is to apply modern topic modelling techniques such as Latent Dirichlet Allocation, Non-Negative Matrix Factorization and BERTopic to the Archelec corpus of candidate's manifestos from the French legislative (parliamentary) elections from 1973 to 1993. This paper intends to explore the evolution of the topics in the far-right manifestos in 20 years, which might help to gain understanding of the recent success of the Rassemblement National. The analysis shows that the far-right rhetoric spans topics from anti-communism and criticism of the established power, economical and fiscal measures to the more obvious topics of immigration, national identity, and economic protectionism. While exploring far-right discourse, we also try to understand the differences between Front National and other parties' rhetorical strategies. Our research shows that security, immigration and traditional values narratives remain important in the far-right manifestos. In the 1970s and 1980s we observe an increase in anti-communist and anti-establishment rhetoric that showcase how these movements capitalize on the geopolitical situation. It is in 1993 that the agenda seem to specifically target anti-immigration and border control rhetoric. Across the whole period, we observe ideological variety and regional specificity with independantist regional movements. The results also show a homogenization of themes led by the growth of the number of the Front National (FN) candidates and the party's strategy to publish uniform manifestos.

1 Introduction

The contemporary French political landscape since the early 2000s has been influenced by the normalization of the *Rassemblement National* (RN) - previously *Front National*, a far right party. In recent years, From the 2024 European elections and legislative elections (over 30 %) [7] to the municipal elections in 2026, reveal a party that has transitioned from an "outsider" or "marginal" movement into a one of the dominant governing forces. With the RN now leading 57 municipalities of over 3,500 inhabitants and commanding over 3,100 local council seats[6], the party of Marine Le Pen and Jordan Bardella has achieved a high level of institutionalization. The current leadership has successfully entered the acceptable mainstream party stage, as it can be seen as the party gets closer to the business elite [4] and holds more polished, "respectable" rhetoric centered on national sovereignty and the systematic restriction of immigration [1].

To better understand the rise of the French far right, it is important to look back at its history. This study analyzes different far-right movements and different topics in their discourse, rather than focusing only on the *Front National* (FN). By comparing various far-right groups, we can identify which specific ideas might have allowed the FN to eventually outperform its rivals and dominate the political scene.

We focus on the years 1973 to 1993 and legislative elections only, a critical period when the far right moved from being considered as an outsider in a political game, to its first major election victories starting from the 1980s. While in the beginning the idea of this project was to explore the Overton Window phenomenon by having a ground-truth and gradually fine-tuned (year after year) political classification model, finding such model that would work on the corpus turned out to be challenging and the methods was switched to the exploration of salient topics using NLP methods. Through the three different approaches to topic modelling, this paper tracks how the language in candidate manifestos (professions de foi) changed over twenty years.

This research aims to answer the following question: **What were the key themes of far-right campaigns between 1973 and 1993, and how did they evolve throughout time ?** While analyzing this information, this paper also tends to understand what might have made the Front National's message more successful than other far-right parties.

In this paper, we will first describe the data pre-processing steps used to isolate far-right movements from the larger dataset. Next, we detail the technical specifications of the three models used for the analysis: Latent Dirichlet Allocation (LDA), Non-Negative Matrix Factorization (NMF), and BERTopic. This section also explains the use of graphical methods to determine the optimal hyperparameters (number of clusters) for the LDA and NMF models. Following the methodology, we present our findings, tracking the evolution of specific topics over time. Finally, we conclude by analyzing the different thematic strategies identified through our database and visual results.

2 Data pre-processing and preparation

2.1 Extracting far-right candidates

The primary challenge of this work was to isolate far-right candidates from the Archelec archives, as no definitive historical list of far-right candidates is publicly available for the 1973–1993 period. Far-right movements during this era were highly fragmented, ranging from national parties like FN to small regionalist groups for example in Alsace or in Brittany. To ensure a comprehensive selection, we used two metadata columns: candidate support (titulaire-soutien) and formal party affiliation (titulaire-liste).

To identify relevant movements, we scraped political nomenclature from France Politique, cleaning the resulting list of parentheses and passing it to lowercase to match the metadata. We then performed a join operation between this list and manually added words, to extract the final corpus from the metadata, and finally, joined it with the extracted txt files. This data was stored in the csv file, that was sent along with the notebook.

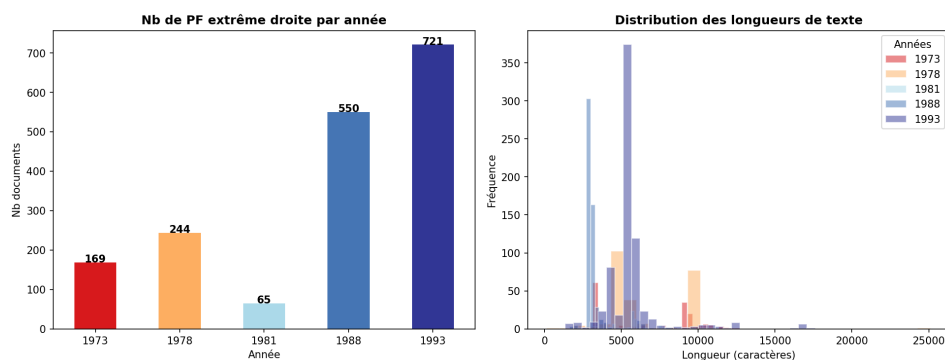

Figure 1: Distribution of far-right parties and document length (characters) by year.

As shown in Figure 1, the number of identified far right candidates generally shows a steady growing tendency since 1973, reflecting the trajectory of these movements and the political climate. We can note an anomaly that occurs in 1981, where only 65 candidates were identified. This might reflect the internal divisions of the movement at the time and the high number of "sans étiquette" (unaffiliated) candidates, which made it difficult to detect all the far-right movements. Considering estimations from the literature, this would represent half of the actual far-right candidate sample.

Regarding document length, the texts are largely concentrated around 5,000 characters. However, the 1978 data exhibits a "bimodal" distribution, with manifestos agglomerated around either 5,000 or 10,000 characters. This homogeneity might point toward a highly coordinated communication strategy and standardized campaign that might have been implemented by the movements.

2.2 Data cleaning and lemmatization

We then proceeded to the text cleaning and lemmatization of the manifestos associated with each candidate in our dataset. The raw text was processed using the SpaCy library. First, we have removed noise and special characters using regular expressions (Regex) to delete some characters and archival mentions (e.g., "CEVIPOF", "Sciences po"). We then applied stopword filtering, using a custom stopword list, merged with a standard french spacy set. After this, we performed lemmatization, which consists in reducing words to their base forms (lemmas) to avoid redundancy of some terms.

We chose to keep the named entities in the data, and did not apply Named Entity Recognition (NER) to our data. In political discourse analysis, references to specific opponents, locations, or figures can be strategic markers that reveal how far-right movements define themselves in opposition to the established power or other parties. The final dataset consists of metadata, cleaned raw text, and lemmatized text.

3 Methodology

3.1 LDA

To analyze the thematic structure of the far-right corpus, we first used **Latent Dirichlet Allocation (LDA)**. LDA is a generative probabilistic model that assumes documents are composed of multiple topics, and each topic is a distribution over words. It works by calculating the probability that a specific word belongs to a topic based on its co-occurrence with other words across the entire dataset.

For the initial vectorization, we used `CountVectorizer` with a **bigram range (1, 2)**. We chose to include mono- and bigrams because far-right discourse relies heavily on compound expressions where the meaning is lost if words are treated in isolation. For instance, while "préférence" or "nationale" are generic terms, the bigram "*préférence nationale*" is a specific ideological marker. Similarly, expressions like "*chômage immigrés*" or "*insécurité quotidienne*" provide the semantic precision necessary to distinguish far-right rhetoric.

To determine the optimal number of topics (K), we evaluated the model's **perplexity** across a range of number of topics - from 3 to 20. Perplexity measures how well the probability distribution predicted by the model matches the actual distribution of the data; mathematically, a lower score indicates a better fit. However, to avoid overfitting and ensure interpretability, we looked for the inflection point where improvements in perplexity become marginal.

As illustrated in Figure 8, we selected $K = 5$ topics. While increasing the cluster count to 7 or higher theoretically lowered perplexity, qualitative testing showed that the resulting topics became redundant and noisy, which complicates the analysis.

3.2 Non-negative Matrix Factorization

Following the probabilistic approach of LDA, we implemented **Non-negative Matrix Factorization (NMF)**. Unlike LDA, NMF is a linear algebraic method that decomposes a non-negative document-term matrix V into two lower-rank matrices: W (document-topic distribution) and H (topic-word distribution). This decomposition method is conceptually similar to Singular Value Decomposition (SVD); however, the non-negativity constraint ensures that the components are purely additive. This property is particularly useful for text analysis, as it allows us to see how a document is "constructed" from a set of distinct ideological themes.

To determine the optimal number of clusters, we evaluated three primary metrics: **Reconstruction Error**, **Cophenetic Correlation**, and the **Bayesian Information Criterion (BIC)**. As shown in Figure 9, we selected $K = 8$ clusters. This value provided the best compromise: a high cophenetic correlation (indicating stable clustering) and a sufficiently low reconstruction error, while maintaining a parsimonious BIC score that prevents overfitting.

To analyze the **topic evolution**, we projected the results from NMF on yearly corpuses - to track the evolution of far-right rhetorics over time. By aggregating the resulting weights from the W matrix, we visualized the thematic shifts over the twenty-year period (Figure 5). To track the evolution of these themes specifically for the **Front National (FN)**, we projected the results on specifically the party's documents to be able to compare the results between all the far-right movement and the Front National.

Additionally, we performed a separate "**year-by-year**" NMF analysis with $K = 5$ topics per year to validate our findings - where the hyperparameter was found similarly to the global NMF analysis. While the year-by-year approach is advantageous for identifying specific thematics for each year, it lacks a consistent coordinate system for direct comparison in time.

3.3 BERTopic

The final methodology is **BERTopic**, a state-of-the-art method that addresses some of the limitations of traditional bag-of-words models by deep learning architectures. Proposed by Grootendorst in 2022 [5], this model is composed of a multi-stage pipeline where documents are first converted into dense vector representations using a **Sentence-BERT (SBERT)**. These high-dimensional embeddings are then reduced via UMAP and clustered using **HDBSCAN**. The primary advantage of this approach is in its contextual awareness. Unlike probabilistic models such as LDA, embeddings discern semantic meaning based on word surroundings, which allows the model to distinguish between different uses of identical terms depending on their context. Furthermore, BERTopic is designed for dynamic topic modeling [8]. This enables the analysis to observe how far-right themes evolve chronologically and maintain semantic coherence even as vocabulary shifts across the period. However, this method is computationally costly, and we therefore chose to use a small model to run or analysis.

4 Results

4.1 Latent Dirichlet Allocation

The LDA model helped us to identify five thematic clusters. The most frequent terms for each topic are visualized in Figure 2, representing the primary pillars of the far-right platform during the 1973-1993 period.

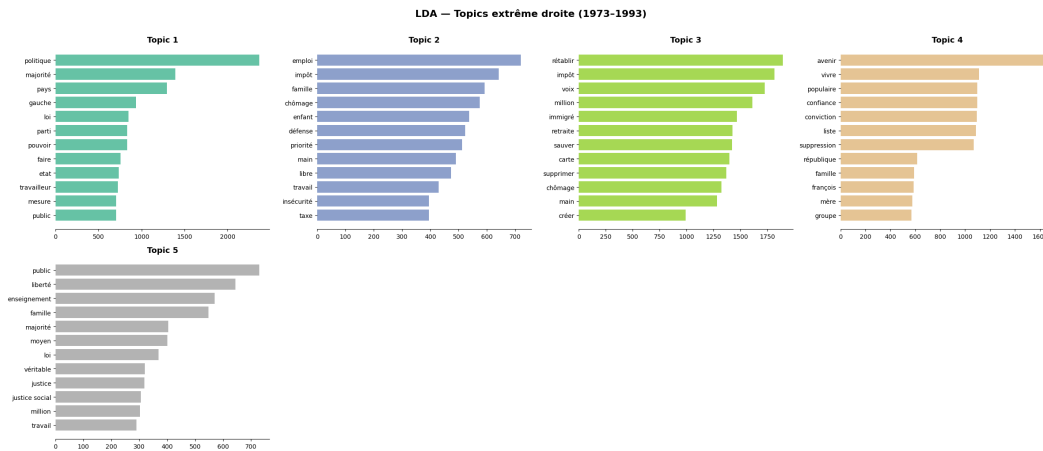

Figure 2: Top words associated with the five identified LDA topics.

In this analysis, the first topic appears primarily centered on structural politics and mobilization, characterized by terms such as "party", "majority", and "left". The second topic shifts toward social policy and domestic protection, emphasizing family, children, and labor (traditional values) alongside mentions of taxation and insecurity. Topic three focuses specifically on fiscal measures, pensions, and the restriction of immigration, while topic four uses rhetoric often referred to as "langue de bois", incorporating terms like future, trust, and confidence, alongside likely references to Mitterrand's name (François). Topic five is defined by concepts of social justice, work, and freedom, suggesting a

discourse that plays on the social justice aspirations and trying to conquer the votes from workers. Examining the *Front National* specifically through a longitudinal lens (see Figure 3), the first topic predominates in 1973, followed by a surge in the 5th topic (mentioning family, law, freedom and teaching) during the 1978 and 1981 election cycles. By the mid-to-late 1980s, the aspirational rhetoric of topic four (langue de bois) increases in importance, eventually giving way to the economic, security and immigration-focused themes of topics two and three. This trajectory indicates that while anti-immigration ideas has been a constant since the party's creation in 1972, there has been a clear discursive shift from traditional political vocabulary toward social justice and, ultimately, a more specialized economic and anti-immigrational agenda. Notably, the *Front National* employed a strategy of distributing near-identical manifestos during the 1978 and 1988 elections (see Annex 12, 14), a coordinated effort that underscores the party's centralized communication strategy for parliamentary elections. This could also explain surprisingly high homogeneity among the topics of the party - over 70% focused on one specific topic every year.

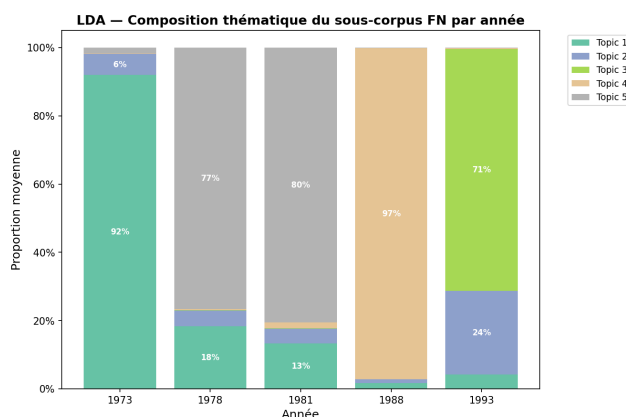

Figure 3: Topic importance evolution across the FN's manifestos 1973-1993

4.2 Non-negative Matrix Factorization

Based on the top words generated by the NMF decomposition (visualized in Figure 4), we manually labeled the eight identified topics to reflect the fundamental topics of far-right rhetoric: (1) Political alliances, (2) Migration control, (3) Nationalist rhetoric, (4) Economic policy and law, (5) Traditional values, (6) Mobilization and unity, (7) Anti-establishment rhetoric, and (8) Local security and order.

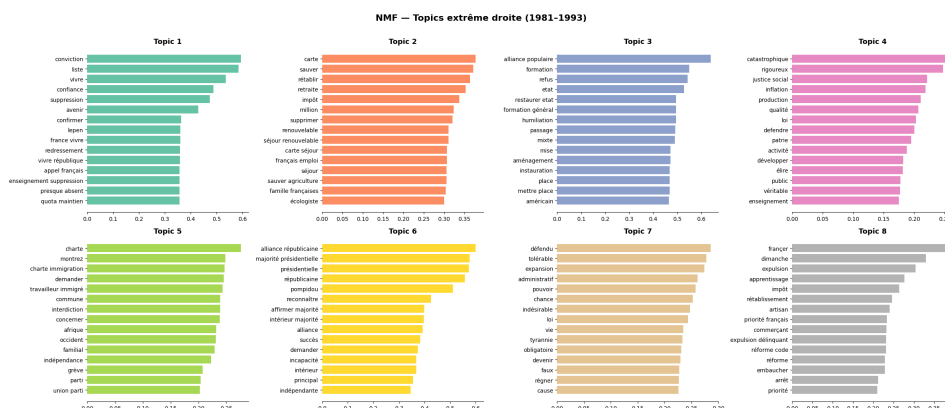

Figure 4: Thematic results and word distributions for the 8-topic NMF model.

The analysis reveals significant temporal shifts in thematic prominence and salience. We observe a spike in "Political Alliance" rhetoric in 1988, while the "Economic Policy and Law" topic dominates the 1978 and 1981 elections, reaching nearly 60% in 1981 before declining. Visualisation of the

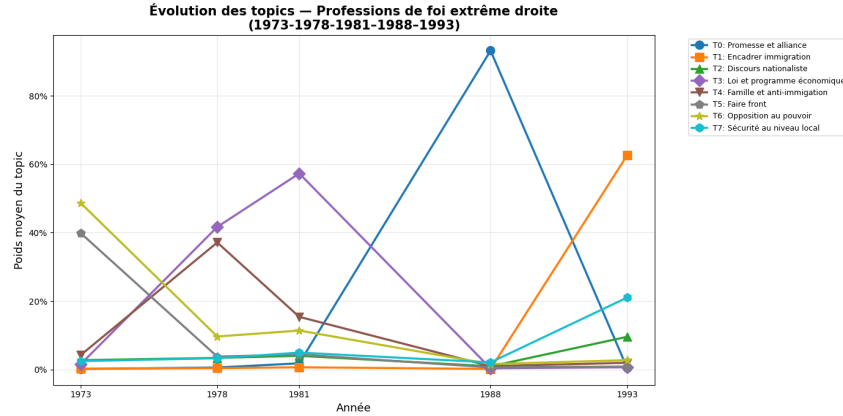

Figure 5: Thematic evolution of far-right parties topics (1973-1993) via NMF weight projection.

evolution of topics for the Front National (FN) specifically indicates that these trends are largely driven by the party's own thematic focus (see Annex - 10). Economic discourse accounts for 69% to 74% of the FN's manifesto content in those years. While "Mobilization" and "Anti-establishment" themes were prominent across the broader far-right spectrum in 1973, the FN specifically prioritized anti-establishment rhetoric, which reached 80% of the topic distribution of the party discourse that year. The 1988 surge in alliance-related language is directly attributable to the FN (Figure 5), facilitated by a highly uniform, nationwide campaign strategy¹⁴. However, from the NMF analysis, explicitly nationalist and anti-immigration rhetoric appears less dominant in the FN's overall distribution until 1993, when "Local Security" and "Migration Control" (specifically mentions of the *carte de séjour*) shows sharp increase. This might suggest a strategic effort by the party to adopt a more "mainstream" ideas in its manifestos, while masking its initial xenophobic rhetoric to facilitate the normalization of its core ideology.

Table 1: Evolution of Key Topics in Far-Right *Professions de Foi* (1973–1993)

Year	N	Top Keywords by Topic
1973	169	T1: défendu, français, public, loi, pouvoir, france, commun, pays, tion, tolérable, administratif, expansion T2: alliance républicaine, majorité présidentielle, alliance, reconnaître, refuser, pompidou, demander, entendre, république T3: etat, famille, droit, défense, majorité, français, nation, communiste, enfant, europe, travail, loi T4: français, falloir, france, pays, défense, vie, économique, pouvoir, famille, ancien, liberté, contrôle T5: public, pouvoir, avenir, intérêt, falloir, service, république, entreprise, enfant, présidentielle, agir, homme
1978	244	T1: public, enseignement, moyen, famille, rétablir, catastrophique, defendre, rigoureux, penser, activité, inflation, loi T2: politique, travailleur, demander, mandat, familial, pays, indépendance, mesure, charte immigration T3: opinion, chance, clair, code, gauche, pénal, code pénal, exprimer, constitution, justice, majorité, protéger T4: gaulliste, union gaulliste, progrès, compagnon, union, secrétaire, indépendance T5: etat, pouvoir, politique, société, loi, familial, grand, salaire, allocation, million, économique, enfant
1981	65	T1: public, populaire, social, majorité, économie, patrie, élire, développer, famille, liberté patrie, rétablir, rassemblement T2: savoir, gauche, pouvoir, opposer, réclamer, combattre, idée, françois, information, parti, campagne T3: france falloir, majorité, objectif, chirac, réaliser, appel, résultat, ignorer, lecanuet, année, éviter, inverser T4: public, defendre, rétablir, liberte, patrie, famille, social, marxiste, rassemblement liberte, inflation T5: coalition marxiste, public, majorité, social, patrie, économie, battre coalition, développer, rassemblement
1988	550	T1: entente, populaire liste, enfant, remplaçant éventuel, remplaçant, lepen, jemenin T2: (<i>Alsatian/German</i>): sich, haben, wählt, ihr T3: Paris, rue général Clergerie, entente T4: fiscal, avenir redressement, trafiquant assassin, fiscal social, socialiste T5: France française, socialisme, confiance, perdant, avenir france
1993	721	T1: rétablir, impôt, immigré, séjour renouvelable, supprimer, carte T2: priorité, étranger, drogue, expulsion, commerçant, artisan, réduction, pouvoir T3: refus, maintien, place, etat, alliance populaire, création, formation, mise, instauration, homme, intérêt T4: suppression, apprentissage, lutte, défense, création, allègement T5: (<i>Alsatian/German</i>): Alsace, einwanderung, steuern

The results of the year-by-year NMF, detailed in Table 1, further clarify different discourse changes over time. Throughout the period, far-right rhetoric consistently orbits the intersection of traditional family values and immigration, often mentioning "children" and "family" explicitly, as well as economic anxieties such as unemployment ("*chômage*"). In the 1988 and 1993, the emergence of Alsatian terms highlight growing regionalism parties in the area. The 1988 also feature mentions of "replacement" (potentially referring to the "great replacement" theory) and the name of Jean-Marie Le Pen, reflecting the FN's strategy with the manifestos explicitly showing Le Pen in 1988. Historical context in politics can also be observed in the earlier years: the 1978 data reveals an "Alliance and Gaullism" cluster (*union gaulliste, progrès*), while the 1981 discourse prominently mentions Mitterrand and "Marxism", showing a shift in far-right rhetoric toward more anti-communist ideas, playing on the context of the fear of communism in Cold War.

4.3 BERTopic

The BERTopic results indicate a clear difference between fragmented ideological landscape and a centralized discourse. As detailed in Table 2, the core of the movement's identity has remained remarkably consistent: the intersection of the discourse on immigration and unemployment. With over 1,000 manifestos dedicated to these themes, the data reveals a steady and important presence of these topics overtime, confirming some of the previous results found with LDA and NMF. The evolution of this topic is visualized in the temporal distribution in Figure 6. The data shows a consistent upward trajectory for these primary themes during the 20 years, showcasing not only the growth of the Front National as a movement, but also the normalization of the anti-immigrational discourse over time.

Table 2: BERTopic Output: 10 Topics in far-right legislative discourse (1973-1993)

ID	Count	Top Keywords	Representative Rhetorical Markers
0	1006	français, france, nationale, ans, immigration, immigrés, voix, chômage	<i>FN 1993</i> : "Les Français d'abord", "Organiser le retour des immigrés", "Revenu parental", "Priorité nationale".
1	169	nationale, avenir, députés, france, candidats, confiance, populaire	<i>FN 1988</i> : "Force d'avenir", "Redressement national", "7 raisons de voter pour le candidat du Front National".
2	61	politique, travailleurs, nouvelles, parti forces, forces, pays, charte	<i>PFN 1978</i> : "Charte de l'immigration", "Halte au terrorisme syndical", "Pour une Europe des Nations".
3	51	majorité, alliance républicaine, républicaine, majorité présidentielle, alliance	<i>ARIL 1973</i> : "Soutien au Président Pompidou", "Contre les insuffisances de l'UDR", "Capitalisme populaire".
4	12	français, immigration, ans, impôts, chômage, insécurité, immigrés	<i>FN 1993 (Aggregated)</i> : "Immigration, Chômage, Impôts, Injustices, Corruption... Ça suffit !".
5	10	majorité, majorité présidentielle, présidentielle, alliance républicaine	<i>ARIL (Regional)</i> : "opposons-nous à l'U.D.R.", "soutien Pompidou", "Justice sociale et anticommunisme", "Regionalisation".
6	9	etat, majorité, droit, défense, communiste, fonctionnaires, nation	<i>FN 1973</i> : "Droite Sociale, Nationale et Populaire", "Contre l'odieuse alternative du communisme".
7	9	12, 12 ans, ans, alliance populaire, formation, mise, refus, place	<i>AP 1993</i> : "12 ans de socialo-mitterrandisme", "Pays sinistré", "Sanctionner cette gauche du désastre".
8	8	opinion, chance, exprimez, gauche, exprimez opinion, code pénal, pénal	<i>FN 1978</i> : "Ma candidature est avant tout anti-marxiste", "Oui veut dire Oui", "Appliquer rigoureusement le Code pénal".
9	8	alliance populaire, alliance, peuple, 000 emplois, france, pays	<i>AP 1993 (Economic)</i> : "Allègement de la fiscalité", "Lutter contre l'exclusion sociale", "Défense de la langue française".

The model also captures the shifting geopolitical anxieties of the era, with topics focusing on anti-communist rhetoric. During the 1970s, the discourse was leveraging Cold War fears to discredit the left as a threat to the nation and showcase far-right movements as an alternative and protection against the "marxist threat". By 1993, the rhetoric also evolved to include more structured arguments regarding fiscal policy and social justice. This shift highlights a strategic change in the far-right movements discourse ; while the far-right movements maintained its "anti-establishment" edge by critiquing the government, FN specifically began adopting the language of a party capable of governance. Furthermore, the early and persistent focus on law enforcement ("code pénal") confirms that security has always been one of the important pillars of the far-right discourse.

Finally, the semantic map in Figure 11 the presence of highly coordinated communication strategies. The existence of dense clusters representing near-identical manifestos across different regions points to a centralized messaging strategy, that can be further explored in the notebook attached to this report. While these clusters confirm previous results o coordinated strategies, the model also reveals that the underlying ideological pillars remain stable (many of these clusters are attributed to the anti-immigrational topics).

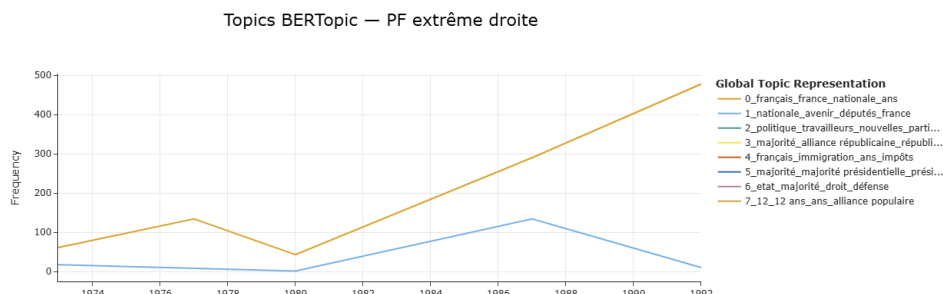

Figure 6: Dynamic Topic Modeling showing the evolution and concentration of far-right themes from 1973 to 1993.

4.4 TF-IDF and wordclouds

To isolate the specific rhetoric of each election cycle, we performed a year-by-year TF-IDF analysis and visualisation as a complementary analysis to our topic modelling. By treating each year as a single aggregate document, we identified terms that are statistically unique to specific periods rather than just frequent in general. These results are visualized in Figure 7, where the size of each word reflects its relative importance for that year.

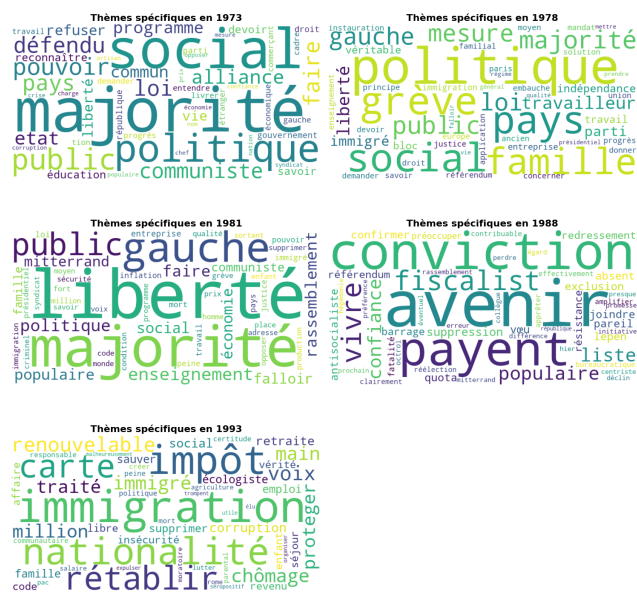

Figure 7: Wordcloud of distinctive terms by election year based on TF-IDF scores.

The results show a thematic shift over the two decades. The 1970s were characterized by traditional social and institutional concerns, with 1978 focusing on labor and family issues through terms like *grève* (strike), *social*, and *embauche* (hiring). By 1981, the discourse mentioned anti-communist rhetoric and criticism of the opponents, highlighting *communiste*, *inflation*, and *Mitterrand*. Words such as *liberté*, *famille* remain important as well.

As the movement entered the late 1980s, the language became more aspirational (*langue de bois*) and fiscal, featuring words like *conviction*, *fiscalité*, and *confiance* (trust). By 1993, the focus shifted to immigration. Terms such as *immigration*, *nationalité*, and *carte de séjour* (residence permit) dominate the corpus, reflecting the Front National's shift to openly anti-immigration and border control rhetoric. It also mentions topics related to the economic policy (unemployment) and insecurity. These results are aligned with the findings from the first stages of our analysis.

5 Conclusion

This research aimed to track the evolution of far-right movements discourse between 1973 and 1993 and to identify whether the Front National (FN) employed a distinctive strategy to achieve its political dominance. Our analysis confirms that while anti-immigration and security remained salient topics throughout the period, the movement's rhetoric underwent significant shifts related to the political context of the time.

By the late 1980s, the discourse expanded to include more detailed economic and fiscal policies, addressing unemployment and social justice. This was accompanied by a steady emphasis on traditional values, that can be seen through the emphasis in the party's rhetoric on family and children. Furthermore, far right movements seem to have capitalized on anti-communist sentiment and fear and anti-establishment rhetoric to position itself against the government and as an alternative to the communism. A sharp surge in immigration control topics was particularly present in 1993 mostly due to the increase in the number of candidates from the FN, the party's core ideology being openly showcased and its communication strategy.

A key finding of this study is the highly coordinated communication strategy adopted by the Front National since the 1970s. The party also transitioned from a general emphasis on French identity to a more specific anti-immigrant stance, sing identical manifestos across different regions to ensure a unified national brand. This strategy was employed by the party several times - in 1978 and in 1988 for example.

While this study provides a basic overview of these thematic shifts, it faces certain limitations. Specifically, the data remains incomplete due to the high number of candidates listed as "unaffiliated" in the archives, especially in 1981. This could have an impact on the results from this year. Coordinated strategies and imbalance in the dataset (Front National becoming more predominant over time) complicates the analysis of the distinction between the party and other far-right movements. Future research could expand on these findings by employing alternative computational methods to quantitatively measure the movement of the "Overton Window" and its impact on the wider political landscape.

5.1 AI use - disclaimer

As I recognize the importance of transparency on the AI use, I acknowledge the use of Gemini model to enhance my writing (although the major part was written by my own hands) with systematic review and reformulation, and to fix some of the latex and coding issues. Example of typical prompts : "Below is the paragraph I have written. Reformulate to make the style more formal, keep it short and concise. Render in Latex". For the coding part, the code was systematically reviewed and checked with the sources and official documentation. The structure of the report, research question and data analysis are original ideas, inspired by the work of the scholars in the area of political science as well as by the journalistic work on the far right. As I value transparency and believe that it should be reciprocated, I would like to be notified if the grading of this assignment undergoes automated treatment by any type of algorithms, including LLMs.

ELECTIONS LEGISLATIVES DU 12 MARS 1978
DEPARTEMENT DU DOUBS -- 1^{ère} CIRCONSCRIPTION

CANDIDATURE DU **FRONT NATIONAL**
(Président Jean-Marie LE PEN) soutenu par le Centre Démocrate et Républicain

Candidat **Michel DIDIER**
Comptable

Suppléant **Etienne PECQUEUR**
Retraité

Françaises, Français,

Les partis politiques, qu'ils soient de la majorité ou de l'opposition de gauche vous mentent. Ils monopolisent la télévision et la radio et prétendent aujourd'hui vous obliger à choisir dès le premier tour entre eux et entre eux seulement.

Le **FRONT NATIONAL** affirme que les Français doivent choisir librement, en confrontant leurs aspirations avec les engagements des candidats, établissant ainsi un véritable dialogue.

Nous vous proposons une méthode originale pour savoir ce que nous pensons et nous éclairer sur ce que vous pensez.

Voici les dix problèmes importants qui se posent à la France avec les solutions que nous proposons. Chaque fois que vous êtes d'accord, cochez la case correspondante.

- ☐ **RETABLIR ET RENFORCER L'UNITE NATIONALE** en abolissant le scrutin majoritaire qui coupe la France en deux blocs ennemis. Réformer la Constitution pour établir un véritable régime présidentiel équilibré par une Assemblée élue à la proportionnelle et une Cour Suprême, juge de la légalité.
- ☐ **SUPPRIMER LE CHOMAGE** en arrêtant totalement l'immigration et en organisant le rapatriement progressif de la plupart des immigrés. Il est aberrant qu'il y ait en France un million de chômeurs alors que la France abrite cinq millions d'étrangers, fardeau insupportable en période de crise.
- ☐ **JUGULER L'INFLATION** par la réduction des dépenses publiques, condition de la diminution des impôts et des charges de toutes sortes. La hausse des prix et l'inflation frappent d'abord les familles modestes, les personnes âgées, les retraités, les rentiers. L'indexation automatique et rigoureuse des ressources des catégories défavorisées est une mesure de justice sociale élémentaire et urgente.
- ☐ **RETABLIR L'ORDRE ET LA SECURITE PUBLIQUE.** La sécurité des citoyens doit passer avant le confort des bandits. La faiblesse de la répression, l'insuffisance des effectifs provoquent la montée du terrorisme, de la criminalité, de la délinquance. Le **FRONT NATIONAL** est pour la police contre le crime, pour les honnêtes gens contre les criminels. Il réclame une application rigoureuse du Code Pénal et de la peine de mort.
